Service Descriptions

WEB DEVELOPMENT
Party in the Front-End. Business in the Back-End.

We develop responsive websites, web applications, and ecommerce solutions that function as amazingly as they look. Whether rebuilding your current site or starting completely from scratch, we've got you covered for whatever the project scope may be.

Prefer a particular CMS system? We'll develop your site using WordPress, Laravel, Drupal, SiteCore or many others of your choosing. Database options include: MySQL, MS SQL, or a no-SQL database such as MongoDB. We typically employ HTML, CSS and JavaScript for the front-end and .NET, PHP and Java for the back-end.

Our sites are then hosted on blazing fast servers, where we can continue to manage them for you, or send you on your way if you prefer the DIY approach.

MOBILE APP DEVELOPMENT
A Powerful Tool in Your Pocket.

Our mobile apps are crazy good. This is thanks to our veteran team of developers who have helped create iOS, Android and Windows Phone apps for prominent companies across the globe like Medyear, General Motors, Wing and Datasite Technology. The mobile development suite we typically use includes but is not limited to: Xamarin, Swift, C#, .NET, Python and Java.

We strive to make your daily life a little bit easier with the help of technology, and a cleverly designed mobile app can do wonders in this regard. Wondering how a mobile app could streamline your business—or have an idea for an app but don't know where to begin? Reach out to us and let's start talking!

RESPONSIVE DESIGN & UX
Beauty and Brains.

What good is an application for if it's not aesthetically pleasing or user friendly? We take great care to ensure that the user interface (UI) and user experience (UX) of our software is intuitively designed and structured. Based on our initial strategic talks with you, we work to develop and design an appropriate framework for the project that meets the required user demands in an efficient and gratifying manner.

Our digital artistry extends to responsive web design, mobile app design, and Windows app design. Please note that we like to stay within the realm of software, so we do not offer graphic design services for print materials, nor do we currently offer logo design.

Team Bios

OYBEK
SOFTWARE ENGINEER

✕ AngularJS. .NET. C#. JavaScript. jQuery. iOS & Android Development. Xamarin. Amazon Web Services. Agile Software Development. Photoshop. Visual Studio. ASP.NET.

♥ Driving. Painting.

Oybek's knack for solving complex computing problems would make even Alan Turing blush. He's also particularly fond of migrating. Migrating from Uzbekistan to Los Angeles, for instance. Or migrating ginormous amounts of data from one database to another. Or just getting in the car and driving. Whether by road or by code, Oybek's in search of that perfectly satisfying experience—and why should the experience of your app be any less satisfying?

With an eye for interface and a brain for architecture, Oybek works tirelessly to ensure your software meets the highest standards of user experience. If it ain't perfect then Oybek ain't happy.

JAVOKHIR
SOFTWARE ENGINEER

✕ Java. Android Development.

♥ Music. Travel.

Once upon a time, Javokhir was busy pursuing a career in finance. Then one morning he woke up and smelled the Java (code). Since then, he's been building exceptional Android apps for

companies like <u>Bee Smart Payment Solutions</u> and the revered <u>DataSite Technology</u>. When given a task, Javokhir simply runs off without a peep until the very next thing we hear from him is, "I'm finished!" Where he goes or how he does it, we have no idea. But he sure brews some mighty fine Java (code).

BAHROM
SOFTWARE ENGINEER

✖   iOS Development. C#. .NET. Python. Swift. SQL. Objective-C. JavaScript. jQuery.

♥   Reading. Soccer.

Think you know C#, .NET or Python better than anybody? Then chances are you don't know Bahrom. As principal iOS developer at <u>Wing</u>, one of the hottest startups in Dubai, this guy is an Olympian of coding knowledge and software perfection.

Bahrom also has a vendetta against bugs—not the creepy-crawly kind, but the ones of technical nuisance. Therefore, you will pretty much never find them in his applications. You won't find creepy-crawlies in his apps either. That would be weird.
